

THE PROBLEM

Negotiated savings that never show up on the invoice

Who	Mid-size manufacturers with hundreds of supplier contracts. The loss hits their margins, but no team is responsible for catching it.
What goes wrong	Rebates, volume discounts, early-pay discounts and SLA penalty credits are written into contracts, but invoices are never checked against them.
Why it matters to them	It's money they already earned. Audit firms mostly serve the largest companies, catching it months later for a cut.

\$40M

a year, lost quietly on \$2B
of supplier spend

Under 30%

of companies have a team responsible
for contracts after they're signed

Sources: McKinsey (~2% of spend); Deloitte / WorldCC survey

WHY IT MATTERS

Recover money already earned, before it's paid away

Value it creates

Our estimate for a manufacturer with \$500M of supplier spend

\$2.5–5M

recovered a year, of ~\$10M at stake

3.8–7.5K_{hrs}

of review saved a year, the workload of 2–4 analysts

Proof it works: a real AI pilot found \$10M+ in 4 weeks (McKinsey)

Who would pay

The CFO at mid-size manufacturers, who owns the margin that's leaking. They have thousands of supplier invoices but are too small for recovery audit firms, which mostly serve the Fortune 1000.

How it solves the problem

Nobody owns the check

→ **Every invoice is checked automatically**

Too slow to do by hand

→ **Contract compiled once; rules run with no AI call per invoice**

Found months too late

→ **Caught before payment, so nothing to claw back**

Hard to trust a black box

→ **Each flag shows clause, invoice and calculation; a person approves**

Estimates assume ~50,000 invoices a year, 5–10 min per manual check, 1 in 10 flagged, and 0.5–1% of spend recovered. Sources: McKinsey (2% leakage; 1% saved by not paying incorrect invoices; \$10M+ pilot); PRGX 10-K.

How is this different from recovery audits?

Recovery audit firms prove the money is real. They mainly serve the largest companies and are paid from what they recover. We give mid-size companies continuous checks they can inspect, before payment.

	Recovery audit firms (e.g. PRGX)	Accio Rebate
Who it serves	Mostly Fortune 1000 companies with multi-billion spend	Mid-size companies too
How it's paid	Keeps a percentage of what it recovers	Software the company runs itself
When it catches	Traditionally after payment, through periodic audits	Every invoice, when it arrives, before payment
How it works	Specialist audit teams with their own tools	Rules compiled from each clause; every flag traces to the contract
Supplier impact	Recovery usually means claiming money back from suppliers	Issues caught before payment, so fewer clawbacks
